

## CLUB DESIGN

The design of each golf club determines how the ball will move, lofted or driven farther. The flatter the face the further it will go; the more angled head the higher and shorter it will go.

Modern golf clubs are made from light strong metals to help give power and accuracy.

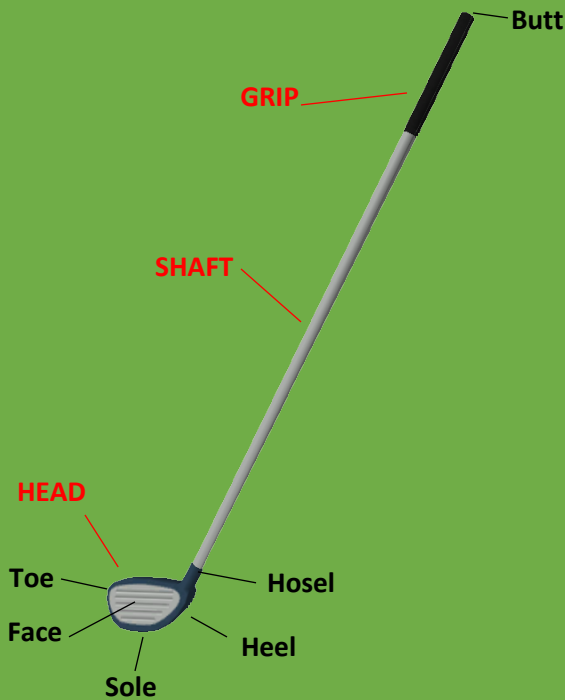

TGA Golf clubs are designed in youth sizes for maximum playability.

Original clubs were made of wood, before advancing to wooden heads with metal shafts.

### PARTS OF THE CLUB

### TYPES OF CLUB

Golfers in a tournament can carry up to 14 clubs in their bag, here a few of the popular club types and what they would use them for.

**DRIVERS & WOODS.**

Launch the ball the farthest.

**HYBRIDS**

Combine woods and irons to sweep the ball.

**IRONS**

Used for chipping, half swing and full swing strokes around the course.

**PUTTER**

Roll the ball along the ground to the hole.

### DESIGN YOUR OWN CLUB

Look around the house and see what materials you can use to make your own golf club.

A suggestion is a cardboard tube, taped to a stick.
